

FoodFinder — Progress Report 5

Course: CS 375 — Web Development

Repository: <https://github.com/VincentYuann/Food-Finder>

Reporting period: Week of August 23 – August 29, 2026

Group members: Jeffrey Cheung, Vincent Yuan, Alvin Cheung

1. Contract Feature Checklist

- ☒ **User accounts, profile, login/password**
 - ☒ **Restaurant search (via Google Places or Yelp API) + save to a personal list**
 - ☒ **Lobby creation and joining**
 - ☒ **Voting system**
 - ☒ **Real-time lobby chat (WebSocket)**
 - ☐ **Account archive**
-

2. Work Completed Last Week

Vincent Yuan — 9 commits, ~1,550 insertions, on the frontend build-out and project documentation.

- Wrote the project documentation the repo had been missing: **DESIGN.md** (248 lines) and **PRODUCT.md** (67 lines), then **README.md** (274 lines, revised the next day) covering the architecture overview, quickstart, and API spec
- Added **ui-feedback.js** (146 lines) — accessible toast notifications backed by an **aria-live** region and in-page confirmation dialogs, replacing the browser **alert()/confirm()** calls the dashboard and lobby had been using
- Built the **winner spotlight** on the lobby page: once a lobby closes, the most-voted restaurant is banner-lined at the top ("Tonight's Pick") with its vote count, and the shortlist re-sorts so the winner leads

Jeffrey Cheung — 2 commits, 542 insertions, making the rest of the lobby live and fixing restaurant photos.

- Options, votes, and the lobby record itself (status, members, chosen restaurant) now broadcast over Socket.IO after every write, so vote cards, the ready button, and the phase change appear without a reload. Cache invalidation moved inside the broadcast helpers, so a write path can no longer push a fresh status while the REST endpoint serves the old one for an hour
- Added **rehydrate()** in **lobbyOptionService**: a shortlisted restaurant whose cached columns were purged is re-fetched from Google rather than rendering as a nameless card
- Fixed restaurant images. Photos are now served through presigned S3 URLs, with a health probe (**isS3Usable**) that range-GETs a single byte, caches the verdict for 60 seconds, and falls back to Google Places when the credentials are rejected — so bad S3 config degrades instead of breaking every image

Alvin Cheung — 3 commits, small but structural (52 insertions, 92 deletions).

- Removed the creator-only finalize step. Any member's ready toggle now advances the lobby: `active` -> `voting` when everyone is ready, and `voting` -> `closed` when everyone is ready again, stamping `closed_at`. This deleted 91 lines of creator-vs-member branching from `lobby.js`
 - Broadcast the votes on that phase change, so tallies are correct the moment a lobby flips rather than on the next click
 - Added the **live vote tally banner** shown during the voting phase — "Live Vote Count: n / m votes cast" — updating as votes stream in
-

4. Git Contributors

Output of `git log --all | grep 'Author:' | sort | uniq`:
