

FoodFinder — Progress Report 4

Course: CS 375 — Web Development

Repository: <https://github.com/VincentYuann/Food-Finder>

Reporting period: Week of August 16 – August 22, 2026

Group members: Jeffrey Cheung, Vincent Yuan, Alvin Cheung

1. Contract Feature Checklist

- ☒ **User accounts, profile, login/password**
 - ☒ **Restaurant search (via Google Places or Yelp API) + save to a personal list**
 - ☒ **Lobby creation and joining** (friends join a lobby for an outing)
 - ☐ **Voting system** — friends pick from saved restaurants, majority wins (*voting itself now works end to end; the majority-wins result is not yet completed*)
 - ☒ **Real-time lobby chat (WebSocket)**
 - ☐ **Account archive** — past visited restaurants + past lobby chats
-

2. Work Completed Last Week

Alvin Cheung — built the voting UI, across 8 commits.

- Added a **voting phase**: when every member marks ready, the lobby flips from **active** to **voting** automatically and everyone's ready flag resets for the new phase (43 insertions in `lobbyController.js`)
- Built the client-side voting controls in `lobby.js` — a Vote button per restaurant option, a live vote count badge, and a "Voted ✓" state — replacing the placeholder that had been there since Report 2
- Gated voting so it is only offered while the lobby is in the **voting** status, and locked further changes once every member has cast a vote (84 insertions in `lobby.js`)
- Restricted option removal so a member can only remove a restaurant they added themselves

Vincent Yuan — 8 commits, mostly on cost control and the Google Places caching layer.

- Extended the **Restaurant** model with `primary_type`, `user_rating_count`, `phone_number`, `website_url`, `google_maps_url` and `opening_hours`, and made the Google-owned columns nullable so the purge can blank them
- Built the shared details modal (`modal.js`), added a cuisine dropdown and mile-based distance to search, and filled in the CSS — the stylesheets that had been empty since Report 2 are now ~1,100 lines, plus a logo and favicon
- Added loading restaurant options into a lobby from either the saved list or a search, and removing them again (273 insertions)

Jeffrey Cheung — 2 commits making the lobby member list live.

- Added `services/lobbyMemberService.js` as the single source of the member-list shape, so the socket snapshot and `GET /api/lobbies/:id/members` return the identical payload and one renderer handles both
 - Broadcast the member list over Socket.IO after any join, removal, or ready change, so ready tallies and the host's Close Lobby button update without a refresh
-

3. Planned Work for the Coming Week

Group priority: finish voting by declaring a winner, and start the account archive — the only contract feature with no work at all, now in its third consecutive report.

Alvin Cheung

- Implement the **majority-wins calculation** (carried over from Reports 2 and 3). Votes are cast, stored, and counted on screen, but nothing tallies them into a result: `chosen_restaurant_id` exists in the schema and is read back by `getLobby`, and no code ever writes it
- Move the lobby to `closed` and show the winning restaurant once the tally resolves

Jeffrey Cheung

- Begin the **account archive** (carried over from Report 3). The dashboard's "Your Lobbies" section lists closed lobbies, but a closed lobby can be deleted outright, so there is no record of past visits or past chats

Vincent Yuan

- **Rebuild the test suite** (carried over from Reports 2 and 3). `backend/tests/` is still gone, `npm test` still invokes Jest, and the project has now shipped three weeks of features with no automated tests
-

4. Git Contributors
