

FoodFinder — Progress Report 1

Course: CS 375 — Web Development

Repository: <https://github.com/VincentYuann/Food-Finder>

Reporting period: Week of July 27 – August 1, 2026

Group members: Jeffrey Cheung, Vincent Yuan, Alvin Cheung

1. Contract Feature Checklist

- ☒ **User accounts, profile, login/password**
 - ☐ **Restaurant search (via Google Places or Yelp API) + save to a personal list**
 - ☐ **Lobby creation and joining** (friends join a lobby for an outing)
 - ☐ **Voting system** — friends pick from saved restaurants, majority wins
 - ☐ **Real-time lobby chat (WebSocket)**
 - ☐ **Account archive** — past visited restaurants + past lobby chats
-

2. Work Completed Last Week

Vincent Yuan — contributed the **Prototype (#1)** merge, ~30 files and the largest single contribution of the period.

- Implemented the full auth flow: bcrypt, JWT, cookie sessions, **verifyJWT**
- Built frontend scaffolding (**index.html**, **login.html**, **auth.js**, **dashboard.js**)
- Added Docker/docker-compose config and a Jest + Supertest test file
- Earlier: initial project setup, **.env.example**, first merge-conflict resolution

Jeffrey Cheung — established the database layer and backend foundation.

- Configured the Express + Prisma + PostgreSQL stack and got the server booting, including the driver adapter newly required by Prisma 7
- Built the SQL design into a full Prisma schema — column types, cascade rules, and composite unique constraints, producing 18 foreign keys
- Generated and applied the migrations; removed **bills** and **bill_splits** after the group's scope decision

Alvin Cheung — repository setup and housekeeping.

- Two initial test commits verifying repository access
 - Added **.gitignore** entries and removed committed **.DS_Store** files
-

3. Planned Work for the Coming Week

Group priority: fix the JWT payload mismatch (Section 4) and the broken test suite. One small defect disables six endpoints, and little else can be tested until it lands.

Jeffrey Cheung

- Fix the JWT defect and verify each affected route end to end
- Implement the **majority-wins calculation** — tally votes per restaurant, compare against member count, set `chosen_restaurant_id` automatically
- Add an endpoint exposing live vote tallies

Vincent Yuan

- **Research WebSockets** and integrate `socket.io` so vote counts update live for every lobby member; extend the same layer to chat
- Write `frontend/JavaScripts/lobby.js`, currently empty — the voting UI has no client-side logic
- Repair and expand the test suite to cover lobby and voting routes

Alvin Cheung

- **Decide between Google Places and Yelp Fusion**, validate the free tier, and implement the search endpoint that caches results into `restaurants`
- Wire search into the dashboard UI
- Fill in the four CSS files, all currently empty — the app has no styling

4. Git Contributors

Output of `git log --all | grep 'Author:' | sort | uniq:`

```
Author: Alvin Cheung <ac4633@drexel.edu>
Author: Jeffrey <jc4759@drexel.edu>
